

Home Sweet Comfortable Home

Think You're Breathing Clean Indoor Air? *Think Again!* Learn About the Dangers of Indoor Air Pollution and How You Can Protect Your Family at www.Honeywellcleanair.com

Most of us don't think about the air that we breathe, but we should! The U.S. Environmental Protection Agency (EPA) says levels of indoor air pollution can be between two and five times higher – and occasionally as much as 100 times higher – than outdoor air. Indoor air pollution can be such a problem that the EPA ranks poor indoor air quality among the top five environmental risks to public health. These statistics are particularly eye-opening, given that we spend upwards of 90 percent of our day indoors.

Think about it – many people drink purified water and use hand sanitizers – but they aren't doing anything to help purify the air that they are breathing. Effective, affordable portable air purifiers, such as Honeywell air purifiers, eliminate up to 95 to 99.97% of microscopic airborne pollutants that pass through their filters (microscopic particles 0.3 microns or larger). Some air purifiers are even effective at fighting germs such as bacteria, viruses and fungi. Portable air purifiers also help circulate the air in a room, usually several times per hour, to reduce airborne allergens and stale air. Consumers should use an air purifier in the rooms where they spend the most time, such as the bedroom and living areas.
